Nanai leather is available in coated and uncoated suede finishes. The uncoated leather shows the natural, open scale surface texture of the skin. The coated leather provides a complementary contrast to the suede finish by a glossy effect. It is stain resistant and water repellent.

For those who like the natural texture of the skin, we have developed our hydro collection, which features water repellent nanai leather in a suede finish. The material has been enriched by a special finishing protecting the leather against liquids and dirt.

The treatment also increases the leather's abrasion resistance in addition to making it soft and very comfortable. This makes the leather ideal for the interior design and wall covering.

Our Guarantee

We are trusted to consistently deliver quality products. Our production flexibility is such that we can meet the needs of designers as well as large scale traders and importers.

We guarantee an unparalleled blend of consistency, responsiveness, and innovation.

Coated Uncoated Hydro

With the proper care and treatment, nanai leather tends to outlast and is more flexible than other leather products. A regular cleaning with a soft brush or dry cloth is essential for preserving the life of the leather.

It is important to note that salmon skins have open scales that naturally lift slightly. This should not be mistaken for damage or dryness.

When treating your nanai leather items, applications should be applied in the direction of the scales. The proper direction can be determined by lightly running your hand along the skin.
